Project 1: Supply Chain & Logistics Analytics

SQL analysis of 3,000 orders across 25 suppliers and 30 products in a dairy/agri-food supply chain — tracking delivery performance, supplier reliability, and shipping cost efficiency.

On-time delivery rate	42.1%
Severely delayed orders (>5 days)	243 (8.1%)
Cancelled orders	77
Average delay	1.57 days
Shipping cost as % of order value	0.22%

Built a supplier performance scorecard (SQL CTEs + conditional aggregation) grading suppliers EXCELLENT / GOOD / FAIR / NEEDS IMPROVEMENT based on delivery success rate and average delay, plus a simulated reorder-point model to flag products at risk of stockout.

Project 2: Sales Analytics

SQL analysis of 5,000 global sales orders — revenue performance, regional and product trends, and sales rep productivity.

Total revenue	\$18.7M
Profit margin	25.0%
Top region	North America (\$6.84M)
Top product	Graphics Card RTX (\$1.44M)

Used window functions (LAG) for month-over-month growth tracking and self-joins for year-over-year product performance comparisons.

Techniques Demonstrated

SQL (PostgreSQL-compatible): CTEs, window functions, multi-table joins, conditional aggregation, KPI design
· Python (pandas) for data cleaning · Business-focused insight writing and documentation
